

CORRECTED ANALYSIS: Actual Structural Changes

- **Files with actual structural changes:** 8 (1.60%)

The 8 Files with Actual Changes

1. **awsclient_860c67.py** (Folder 2)

Change: Parameter reordering in function signature

- Function: `update_function`
- Untyped params: `[..., 'role_arn', 'subnet_ids', ...]`
- Typed params: `[..., 'security_group_ids', 'subnet_ids', ...]` (reordered)
- File impact: +3,787 bytes, -14 lines
- **Nature:** Parameter position change during type annotation

Original has role_arn as a parameter

```
def update_function(self, function_name, zip_contents, environment_variables=None, runtime=None,
tags=None, xray=None, timeout=None, memory_size=None, role_arn=None, # ← exists here
subnet_ids=None, security_group_ids=None, layers=None):
```

GPT-5 removed it from signature entirely

```
def update_function(self, function_name: str, zip_contents: bytes, environment_variables=None,
runtime=None, tags=None, xray=None, timeout=None, memory_size=None, # ← gone!
security_group_ids=None, subnet_ids=None, layers=None):
```

Original

```
security_group_ids=None, subnet_ids=None
```

GPT-5

```
subnet_ids=None, security_group_ids=None # swapped
```

2. **manifest_47c52e.py** (Folder 6)

Change: Two classmethod → instance method conversions

- Functions changed:
 - `_map_list_nodes_to_map_list_resources: cls → self`
 - `_map_nodes_to_map_resources: cls → self`
 - File impact: +4,735 bytes, same line count
 - **Nature:** Refactoring from classmethods to instance methods during typing
-

3. **test_payments_dde789.py** (Folder 6)

Change: New parameter added to test function

- Function: `test_api_payments_with_lock_timeout`
- New parameter: `deposit` (added)
- File impact: +517 bytes, same line count
- **Nature:** Test fixture parameter addition

```
def test_api_payments_with_lock_timeout(api_server_test_instance: APIServer, raiden_network: list,
token_addresses: list, pfs_mock: object, deposit: int) -> None:
```

```
def test_api_payments_with_lock_timeout(api_server_test_instance, raiden_network, token_addresses,
pfs_mock):
```

4. **test_ipython_b46143.py** (Folder 11)

Change: New parameter added to test function

- Function: `test_load_extension_not_in_kedro_project`
- New parameter: `ipython` (added)
- File impact: +731 bytes, +1 line
- **Nature:** Test fixture parameter addition

```
def test_load_extension_not_in_kedro_project(self, mocker: Any, caplog: Any, ipython: Any) -> None:
```

```
def test_load_extension_not_in_kedro_project(self, mocker, caplog):
```

5. **test_stack_unstack_b54311.py** (Folder 11)

Change: New parameter added to test function

- Function: `test_stack_empty_frame`
 - New parameter: `int_frame` (added)
 - File impact: +1,636 bytes, +1 line
 - **Nature:** Test fixture parameter addition
-

this is very critical

6. **forms_6e49d8.py** (Folder 15)

Change: Method renamed

- Removed: `clean_new_password1`
- Added: `clean_new_password`

- File impact: +406 bytes, same line count
- **Nature:** Method name normalization during typing

```
def clean_new_password1(self): new_password = self.cleaned_data['new_password1'] if not
check_password_strength(new_password): raise ValidationError(str(PASSWORD_TOO_WEAK_ERROR))
return new_password
```

```
def clean_new_password(self) -> str: new_password = self.cleaned_data['new_password1'] if not
check_password_strength(new_password): raise ValidationError(str(PASSWORD_TOO_WEAK_ERROR))
return new_password
```

7. test_init_75a7d5.py (Folder 15)

Change: Module-level function → instance method

- Function: `async_describe_events`
- Changed from: module-level function with params `['hass', 'async_describe_event']`
- Changed to: instance method with params `['self', 'hass', 'async_describe_event']`
- File impact: +2,940 bytes, same line count
- **Nature:** Function converted to instance method for typing

8. test_sql_f4958a.py (Folder 16)

Change: New function and control flow modifications

- Added function: `_exec_proc` (new)
- Control flow changes:
 - +1 if statement
 - +3 with statements
- File impact: +7,617 bytes, +9 lines
- **Nature:** Refactored helper function addition with enhanced error handling

this helper added `def _exec_proc(c: object) -> None: if isinstance(c, Engine): with c.connect() as engine_conn:
with engine_conn.begin(): engine_conn.execute(proc) else: with c.begin(): c.execute(proc)`

but wasn't even used by anything propably hallucinating
